

POD Point Twin User Guide

1)

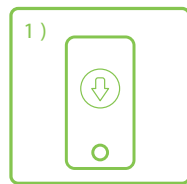

The POD Point Twin consists of two charging units, Door A and Door B. Both operate in the same manner but completely independently.

When car is not plugged in, the lights on the charger should be blue with magenta flashes.

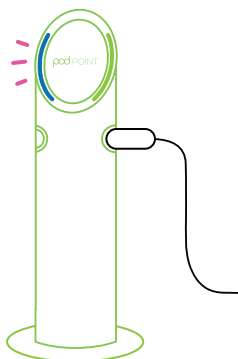

2)

Before using the POD Point twin, you need to download the App for iOS/Android phones or use the web app at: open.pod-point.com

3)

Starting a charge is as simple as plugging in the car. No verification is required. Immediately a charge will start on the door you have plugged into. This is indicated by the LEDs turning GREEN. When a vehicle is connected to the POD Point Twin, the Type 2 socket at the pod will lock the cable into the pod. The vehicle side connector has to be disconnected before the cable can be released from the Pod-Point.

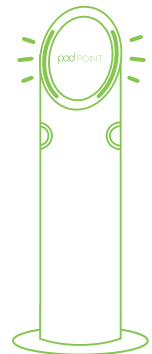

4)

After the car starts charging, you have got **15 minutes** to find the charger on the App and confirm charging. A charge has now been authorised

5)

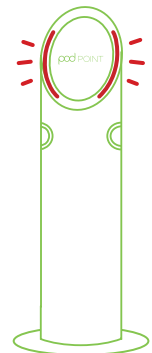

When battery is full or charging has paused/stopped for any reason, the light will go flashing green.

6)

In the unlikely event that the lights go red, it means something's gone wrong. No need to panic, just get in contact and we'll get it sorted.

In case the light turns red, there will be red flashes. Please count the flashes, as this indicates the nature of the fault.
